JOIN OUR RESEARCH

OUR STUDY ON GREEN STREET INFRASTRUCTURE

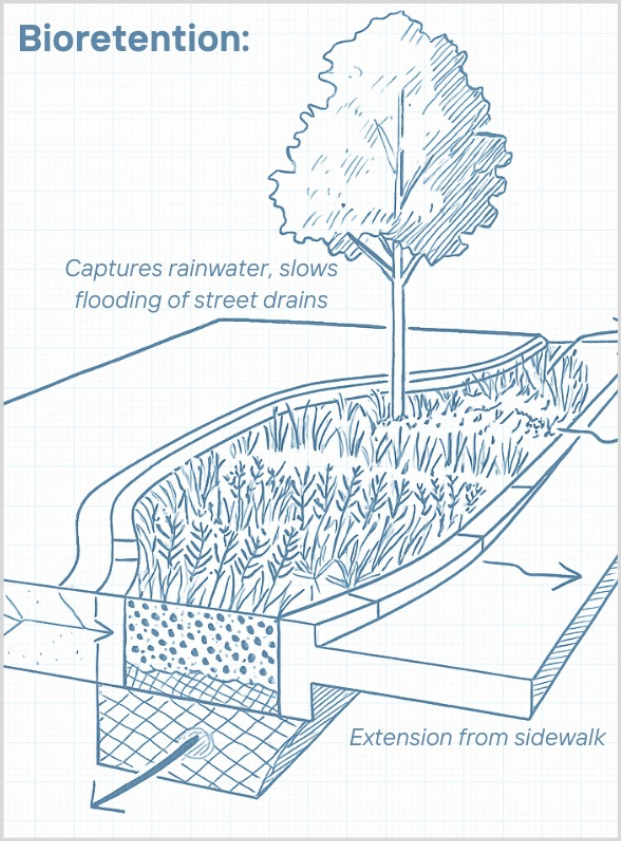

We're a University of Toronto research team studying how Green Stormwater Infrastructure (GSI) — including bioswales, rain gardens, and tree planters — is cared for in communities. **We're looking for residents to share their experiences in a 20–30 minute interview** (online).

Your insights can help reduce street flooding, improve water quality, and create greener neighborhoods — plus you'll be entered to **win one of three $50 Amazon gift cards!**

WHAT IS GSI?

Green Stormwater Infrastructure is a nature-based approach to managing rain and melt snow, prevent flooded streets, homes, and reduce river pollution. Examples include:

- **Bioretentions** – shallow ditches on the street with plants that filter stormwater
- **Rain gardens** – landscaped areas that soak up water
- **Tree planters** – boxed trees on the sidewalk that capture rainwater
